Passive WGM: High-Order Filter

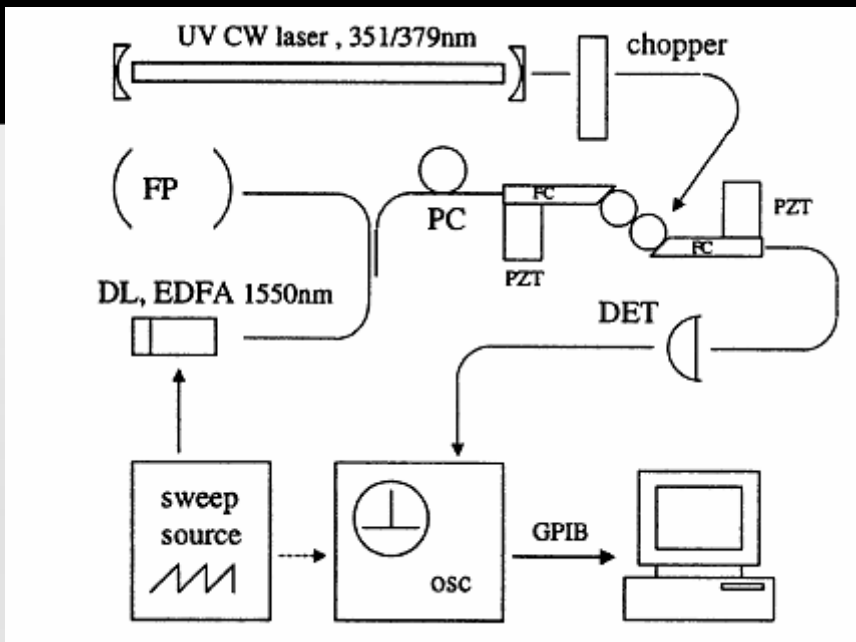

Illustration of a microcavity add/drop filter in which two buried waveguides (shown in brown) are vertically coupled to a disk whispering gallery

Filter spectrum. Thin line depicts experimental results, thick line—Lorentzian fit.

Installation to fabricate a second-order filter.

IEEE PTL Vol. 15 no. 4, 2003

Passive WGM: Tunable Filters

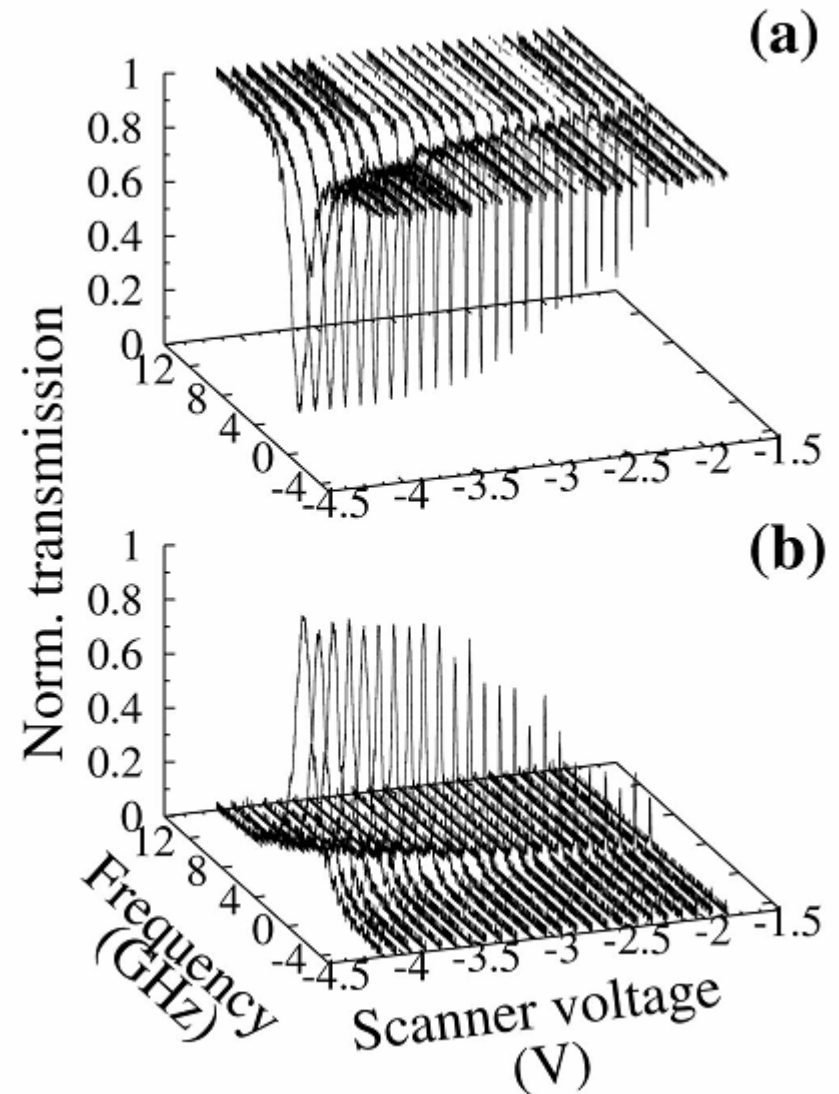

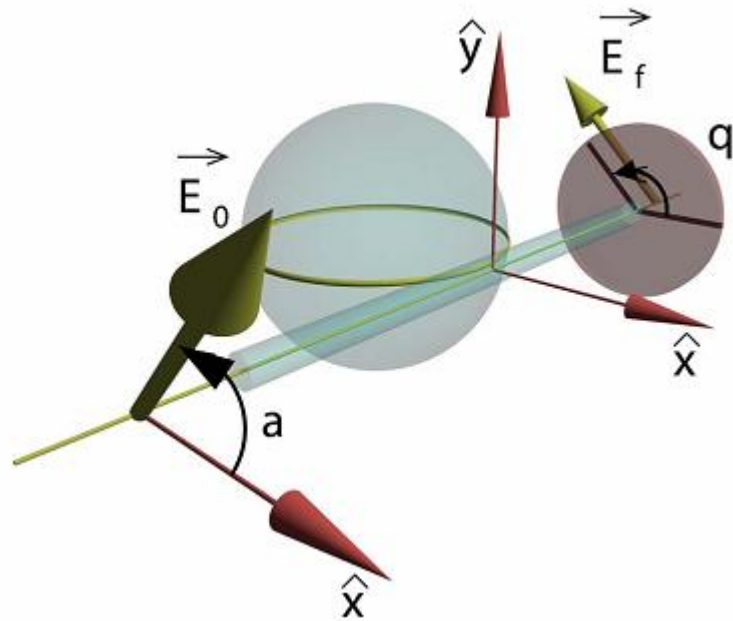

IEEE PTL Vol. 17 no. 1 2005

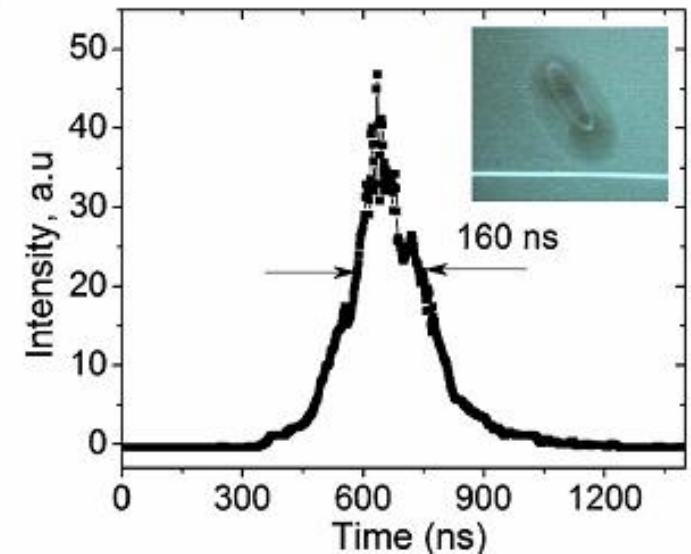

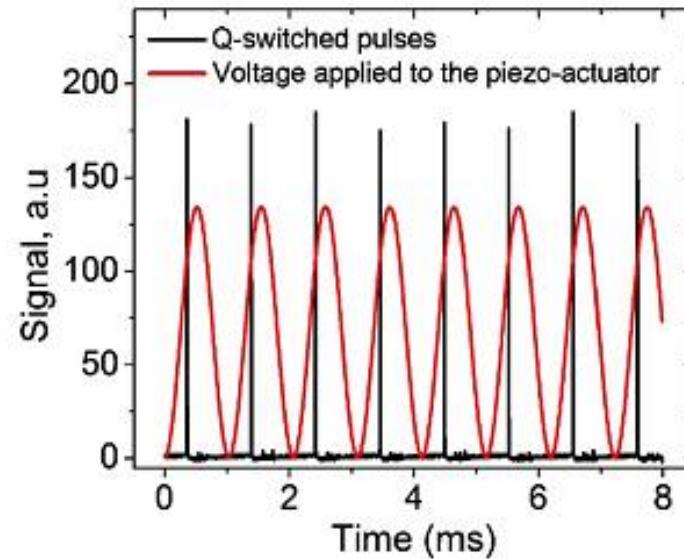

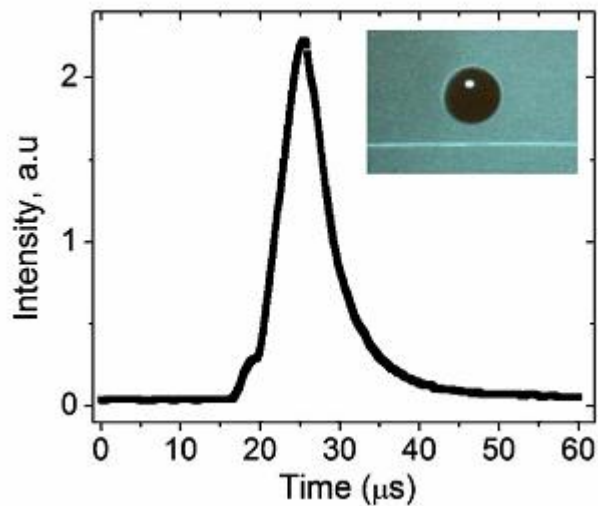

$$\Delta\nu_{TE} = \nu_0 \frac{n_e^2}{2} r_{33} E_Z, \quad \Delta\nu_{TM} = \nu_0 \frac{n_o^2}{2} r_{13} E_Z$$

Tunable third-order optical filter fabricated from the three voltage-controlled lithium niobate whispering gallery-mode resonators. The filter operates at 1550 nm with 30-MHz bandwidth and can be electrooptically tuned by 12 GHz in the linear regime with approximately 80-MHz/V tuning rate. With this filter, we have demonstrated 6-dB fiber-to-fiber insertion loss and 30-ns tuning speed, limited by the resonator buildup time.

Passive WGM: Polarization Convert

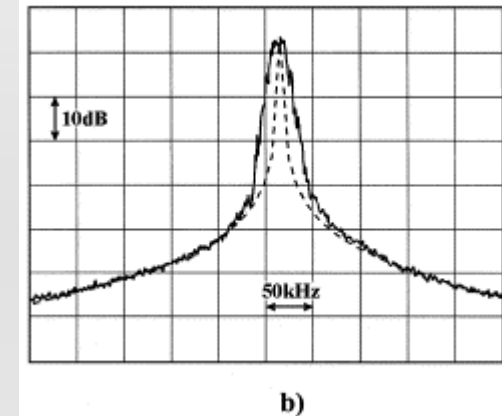

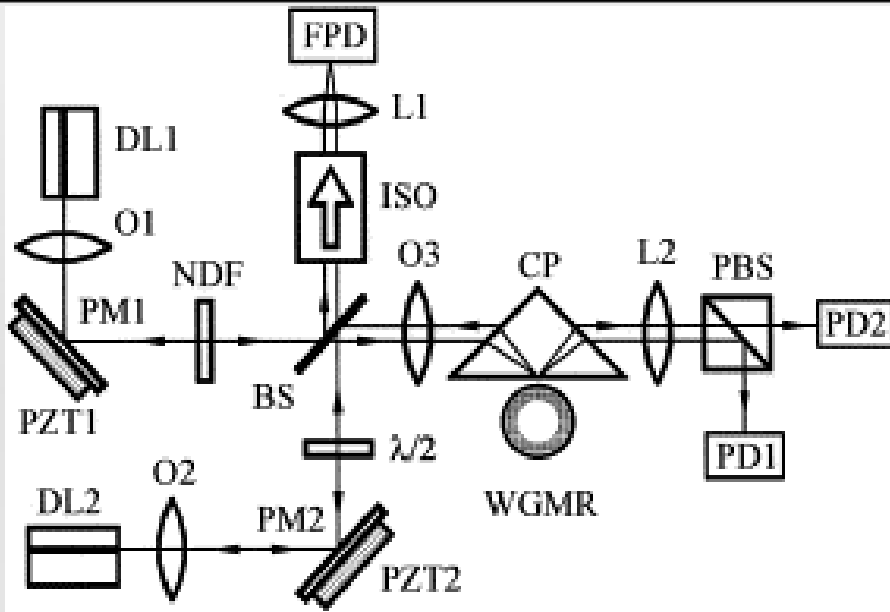

Passive WGM: Laser Applications

Q Switch for a fiber laser.

Narrow diode's linewidth: Microsphere as feedback

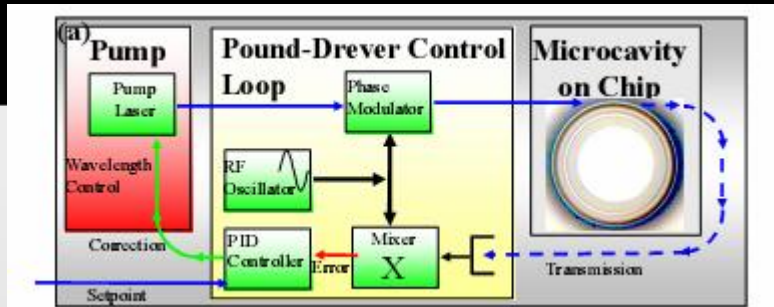

The setup for locking of two lasers to orthogonally polarized modes of the microsphere.

Opt. Comm. Vol. 158, 1999

The beatnote spectrum of two DLs optically locked to the orthogonal modes of the WGMR. (a) Linear scale, frequency span 200 kHz, resolution 10 kHz, sweep time 5 s, video bandwidth 30 Hz. (b) Logarithmic scale, frequency span 500 kHz, resolution 10 kHz, sweep time 10 s, video bandwidth 30 Hz. The dashed curve is the Lorentzian best fit with FWHM of 790 Hz.

Laser lock to the microcavity: Pound-Drever-Hall Method

Experimental Setup

System recovers from perturbation in the regime of thermal instability.

- a) Transmission vs. time of a locked system.
- b) Spectra property of a locked system

Vice Versa: Lock microcavity to a Frequency stabilized Laser

Experimental Setup for Tuning WGMs

Transmission spectra of unlock and lock WGMs

Opt. Exp. 2001

So WG microcavity may be a good candidate for frequency reference

Active WGM: Raman Effect

Nature 415, 7, 2002

Figure 2 Spectrum of a 70- μm -diameter Raman microsphere laser with pump powers of 2 mW. The pump is at 1,555 nm. Peaks located around 1,670 nm are Raman oscillations, separated by the free spectral range of the microsphere. Secondary lines around 1,555 nm are due to four-wave mixing between the pump and two Raman waves. Inset, a microsphere coupled to a fibre taper.

$$P_{\text{threshold}} = \frac{\pi^2 n^2 V_{\text{eff}}}{\lambda_p \lambda_R \Gamma B g} Q_c^p \frac{1}{Q_T^p} \frac{1}{Q_T^R}$$

Application: Cascade Raman Laser

Fig. 1. Typical emission spectrum of the microsphere cascaded Raman laser. The pump wavelength is at 976.08 nm. Inset: optical micrograph of a microsphere taper system used in the experiment.

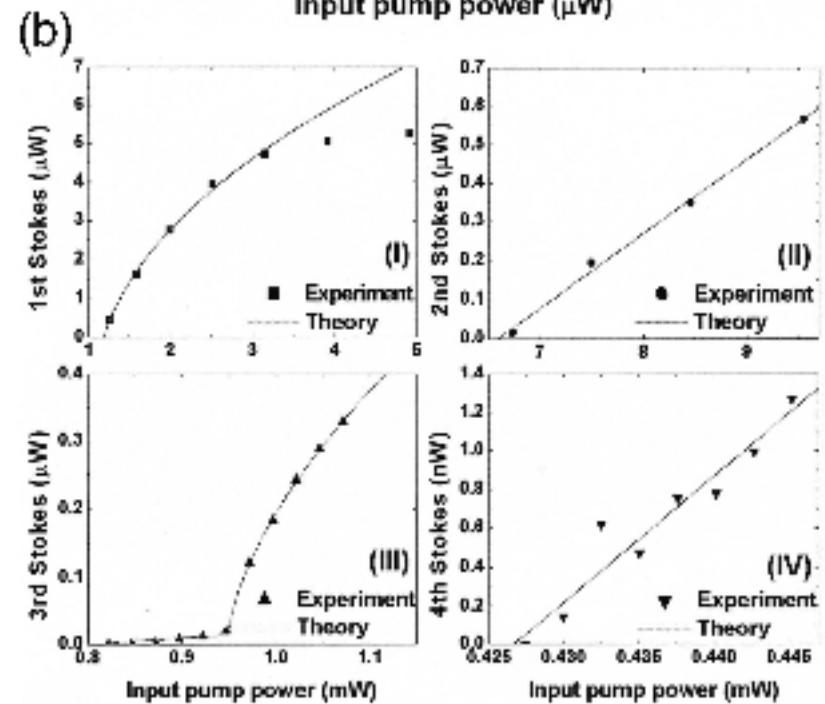

Opt. Lett. 28, 17, 2003

$$P_{\text{th}} = \frac{\pi^2 n^2}{\lambda_0 \lambda_1} \frac{V_{\text{eff}}}{g R^B} \left(\sum_{k=0}^{N/2} \frac{1}{Q_{t, N-2k}} \right)^2$$

$$\times \sum_{k=1}^{N/2} \frac{Q_{e,0}}{Q_{t, N-(2k-1)}} \quad (N \text{ even}),$$

$$P_{\text{th}} = \frac{\pi^2 n^2}{\lambda_0 \lambda_1} \frac{V_{\text{eff}}}{g R^B} \left(\sum_{k=1}^{(N+1)/2} \frac{1}{Q_{t, N-(2k-1)}} \right)^2$$

$$\times \sum_{k=0}^{(N-1)/2} \frac{Q_{e,0}}{Q_{t, N-2k}} \quad (N \text{ odd}),$$

Silicon Cascade microring Raman Laser

Nature Photonics Vol.2 ,170, 2008

By using silicon instead of silica, the laser wavelength extends to MID-IR, which is of great use in many fields. But the cavity here needs improvements.

Active WGM: Kerr Nonlinearity, Parametric Oscillation

Stimulated Raman Scattering

- Coupling to a dissipative phonon bath
- Phase insensitive amplification
- Intrinsically phase-matched process

Parametric Interactions

$$n = n_0 + n_2 I$$

- Mediated by the Kerr-nonlinearity
- Energy conservation
- Momentum conservation
- Phase sensitive amplification

Competition of Raman and Parametric Oscillation

Parametric Oscillation Threshold

$$P_t^K = \frac{\omega_0^2 Q_0^{-2} (1 + K)^2 + (\Delta\omega/2)^2}{2\gamma\Delta\omega (c/n_{eff})} \cdot \frac{\pi^2 R n_{eff}}{C(\Gamma)\lambda_0} \frac{1}{Q_0} \frac{(K + 1)^2}{K}$$

Raman Oscillation threshold

$$P_t^R = \frac{\pi^2 n^2}{C(\Gamma)g_R\lambda_p\lambda_R} V_{eff} \cdot \left(\frac{1}{Q_0}\right)^2 \frac{(1 + K)^3}{K}$$

⇒ **Parametric Regime** $P_{Param}(\Delta\omega, K) < P_{Raman}$

⇒ **Raman Regime** $P_{Param}(\Delta\omega, K) > P_{Raman}$

- Near Unity Signal to Idler ratio
- Up to 40 μ W of parametric power
- Kerr-Optical nonlinear effect in microcavity

Phys. Rev. Lett. 93, 083904 (2004)

\Rightarrow Minimum threshold occurs undercoupled

Applications: Toroid of many colours

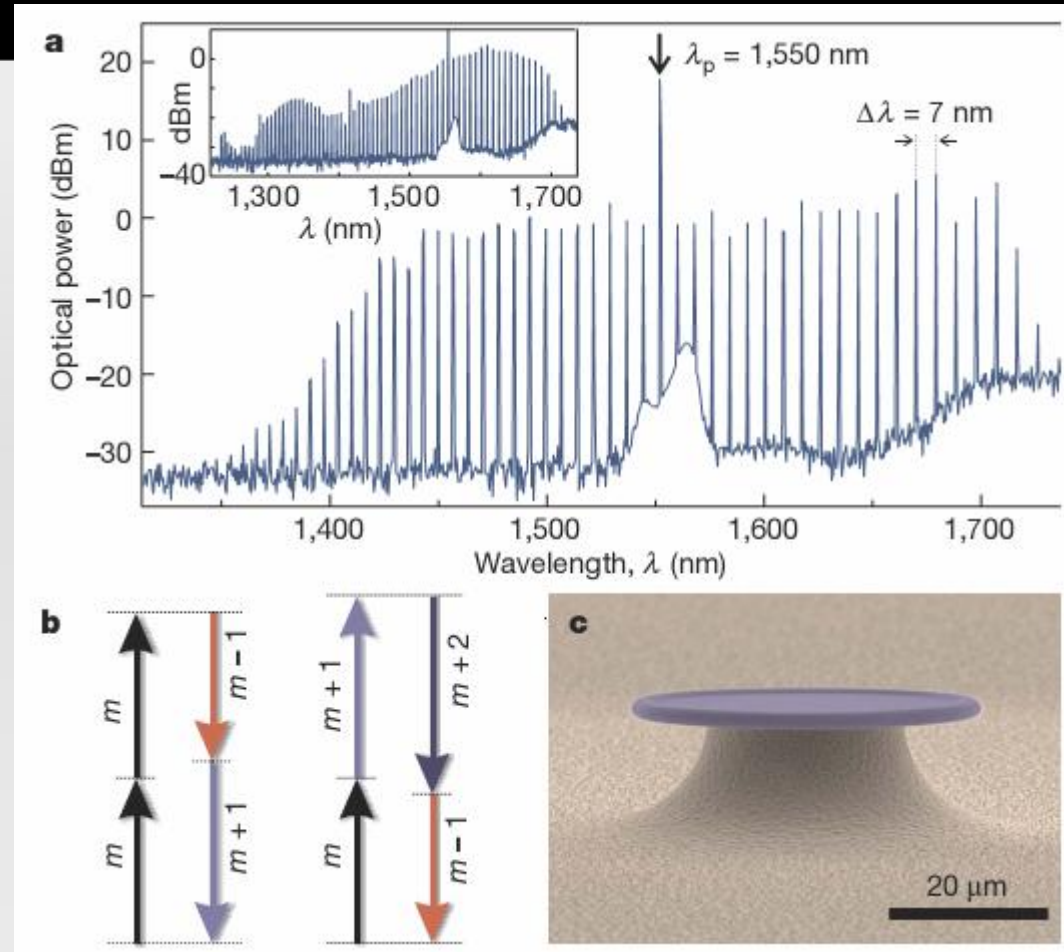

A demonstration of continuous sum-frequency generation of visible light in a microscopic silica resonator could provide a light source for on-chip silicon photonics and applications in the UV.

Crystalline WGR: Photorefractive

Experimental Setup
APL 88, 241909, 2006

Active WGM: Micro Laser

Fig. 3. Experimental setup for the microlaser experiment: WGMs are excited by evanescent wave coupling with a high index prism across the sphere–prism gap g , which can be adjusted with nanometric precision. The pump source is a diode laser (Sharp LT017MDO) operating at 807 nm. By adjusting the diode current, resonant excitation of a sphere's WGM can be observed as a dip on the light transmitted to the photodiode PD1. A 1080 nm probe beam can be superimposed with a dichroic mirror (DM) to measure the cold-cavity Q factor as a function of the gap g . The laser light (or fluorescence) emitted out of WGMs in the fluorescence band and recoupled into the prism is separated from the reflected pump beam by a second dichroic mirror and then passed through a monochromator (resolution 0.02 nm) onto photodiode PD2. The side-fluorescence of the doped sphere is measured with photodiode PD3, after elimination of the scattered pump light with the RG850 filter. The microsphere can also be viewed with a CCD camera coupled to a stereomicroscope (not shown here).

Fused Silica microsphere laser
very low threshold ~200nW

PRA 54, 3, 1996

Er-Yb codoped microlaser

Fig. 1. (a) Image of the taper in contact with the equator of the microsphere. (b) Color image of the green upconverted photoluminescence from the taper-pumped microsphere, where the pump wavelength is tuned close to a fundamental ($|m| = l$) WG mode.

- Taper is tailored so that the 980nm pump light is near critical coupled into the microsphere. 85% pump light is absorbed by sphere
- From the picture of the upconversion of the Er^{3+} , pumping volume is estimated to 1000

Taper coupled microsphere laser

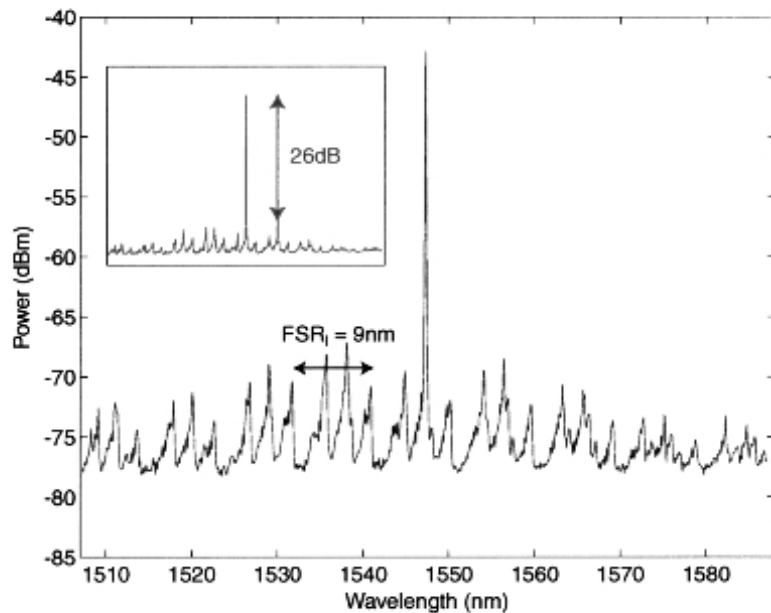

Fig. 2. Photoluminescence spectra [taken at point (a) in Fig. 3, below] of the microsphere for an annular pump region about the equator. The photoluminescence (inset) is taken at point (b) in Fig. 3 (wavelength range matching that of the main spectra), where the side-mode suppression is 26 dB.

Fig. 3. Collected laser output power versus absorbed pump power in the microsphere ($L_{\text{out}} - L_{\text{in}}$). Inset, spectral output of a Fabry-Perot filter, showing the single-mode nature of the microsphere laser, where for reference a single-frequency laser with a known linewidth of 300 kHz is also shown.

**Measured with FP ethanol
60 microWatts, output power 3 microW**

Strong Coupling

Strong coupling between NV center and microsphere

Strong coupling with CdSe nano crystal and polymer microsphere

Nano Lett., **6** (3), 557 -561, 2006.

In GaAs QDs

PRL 95, 067401 (2005)

Modal Coupling together with Strong coupling

Considering Modal Coupling in real microcavity ,by defining normal mode of forward (CW) a and backward (CCW) b, the Hamiltonian can be written:

$$\begin{aligned} H = & \Delta_A \sigma^+ \sigma^- + (\Delta + h) A^\dagger A + (\Delta - h) B^\dagger B \\ & + \frac{1}{\sqrt{2}} [\varepsilon_p^* (A + B) + \varepsilon_p (A^\dagger + B^\dagger)] \\ & + g_A (A^\dagger \sigma^- + \sigma^+ A) \\ & - i g_B (B^\dagger \sigma^- - \sigma^+ B) . \end{aligned}$$

Numerical simulation gives a spectra property of transmission T_f :

$$T_F|_{\omega_p = \omega_C} = \frac{4\kappa_i^2 |g_{tw}|^4 + h^2 (g_{tw}^2 + (g_{tw}^*)^2)^2}{\left[(\gamma/2) (h^2 + \kappa^2) + 2\kappa |g_{tw}|^2 \right]^2 + [\Delta_{AC} (h^2 + \kappa^2) - h (g_{tw}^2 + (g_{tw}^*)^2)]^2}.$$

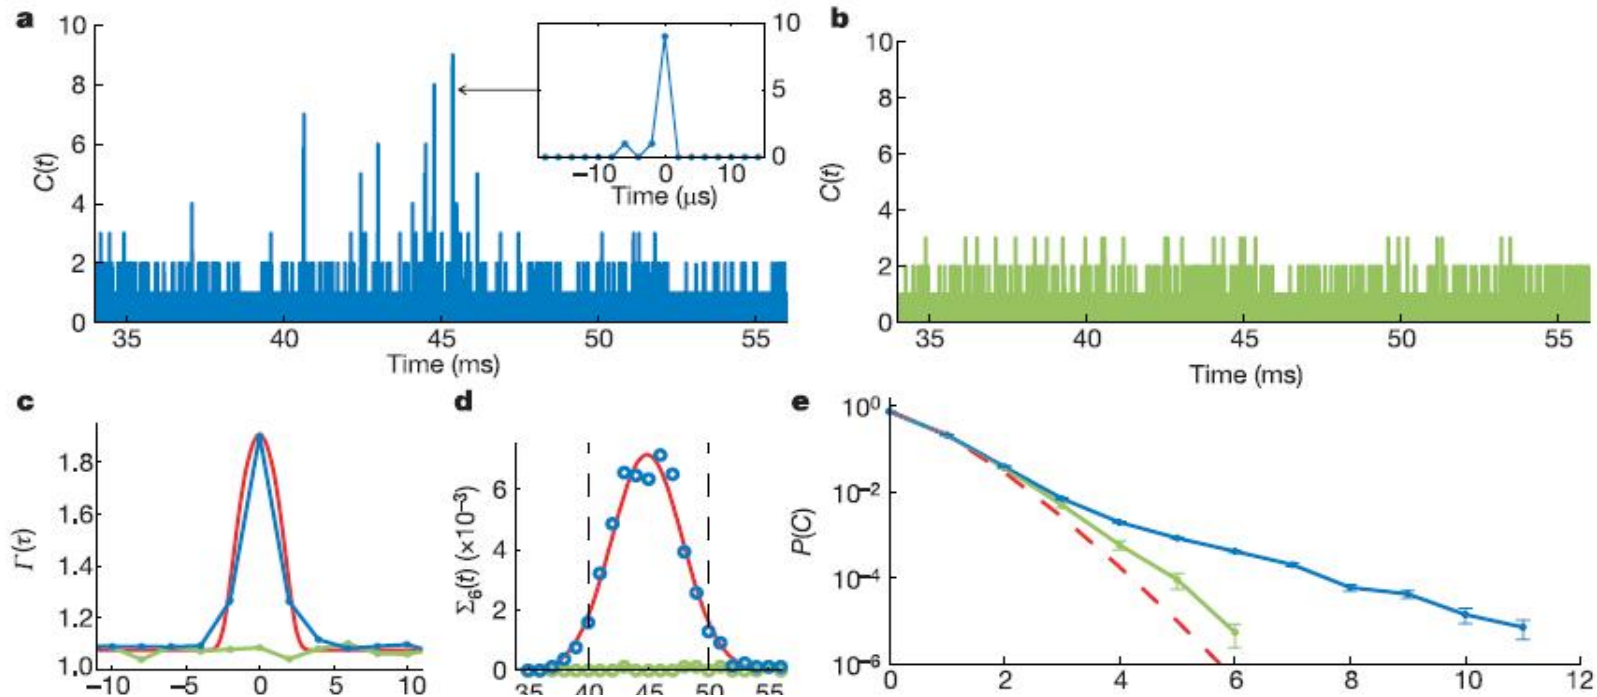

$$\beta = \frac{\gamma}{2} + \frac{2\kappa |g_{tw}|^2 + h (g_{tw}^2 + (g_{tw}^*)^2)}{h^2 + \kappa^2} \simeq \frac{2 |g_{tw}|^2}{\kappa} = \frac{|g_0|^2}{\kappa},$$

A more precise theory must include different case ,which is discussed :[PRA 75, 023814, 2007](#)
